

This question paper contains 16+3 printed pages + Statistical tables Attached}

Roll No.

--	--	--	--	--	--	--	--	--	--	--	--	--

S. No. of Question Paper : 2396

Unique Paper Code : 2271403 F-4

Name of the Paper : Introductory Econometrics

Name of the Course : B.A. (Hons.) Economics

Semester : IV

Duration : 3 Hours Maximum Marks : 75

(Write your Roll No. on the top immediately on receipt of this question paper.)

(इस प्रश्न-पत्र के मिलते ही ऊपर दिए गए निर्धारित स्थान पर अपना अनुक्रमांक लिखिए।)

Note : Answers may be written either in English or in Hindi; but the same medium should be used throughout the paper.

टिप्पणी : इस प्रश्न-पत्र का उत्तर अंग्रेज़ी या हिन्दी किसी एक भाषा में दीजिए; लेकिन सभी उत्तरों का माध्यम एक ही होना चाहिए।

The question paper consists of seven questions.

Attempt any five questions.

Each question carries 15 marks. Use of simple non-programmable calculator is allowed.

Statistical tables are attached for your reference.

इस प्रश्न-पत्र में 7 प्रश्न हैं। किन्हीं पाँच प्रश्नों के उत्तर दीजिए।

प्रत्येक प्रश्न 15 अंक का है। सरल अप्रोग्रामीय कैल्कुलेटर का प्रयोग अनुमोदित है।

संदर्भ के लिए सांख्यिकीय सारणियाँ संलग्न हैं।

P.T.O.

1. Are the following statements correct ? Justify your answers carefully and provide proofs wherever necessary :

- (a) In the regression of Y on X_2 , and X_3 , if all X_3 are identical, variance of partial regression coefficient of X_3 is zero.
- (b) If we multiply both Y and X by 1000 and re-estimate the regression, the slope coefficient will get multiplied by 1000.
- (c) The value of \bar{R}^2 is always greater than R^2 .
- (d) In a simple regression model, at a given level of significance, it is not necessary to perform both t -test of estimated slope coefficient and F-test for the goodness of fit.
- (e) $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + \varepsilon_i$ is estimated as $\hat{Y}_i = \hat{\beta}_1 + \hat{\beta}_2 X_{2i} + \hat{\beta}_3 X_{3i}$ using OLS. Here X_2 and β_1 are random variables and $\hat{\beta}_3$ is unknown. 3x5

क्या निम्नलिखित कथन सही हैं ? अपने उत्तरों के लिए सावधानीपूर्वक तर्क दीजिए व जहाँ आवश्यक हो वहाँ प्रमाण भी दीजिए :

- (a) Y के X_2 व X_3 पर समाश्रयण में यदि सभी X_3 बराबर हों, तो X_3 के आंशिक समाश्रयण गुणांक का प्रसरण शून्य होता है।

- (b) यदि हम Y व X दोनों को 1000 से गुणा करें व समाश्रयण को दुबारा आकलित करें तो ढाल गुणांक 1000 गुना हो जाएगा।
- (c) \bar{R}^2 का मान हमेशा R^2 से अधिक होता है।
- (d) एक सरल रेखीय समाश्रयण मॉडल में एक दिए गए सार्थकता स्तर पर आकलित ढाल गुणांक के t -परीक्षण व फिट की उपयुक्तता (Goodness of fit) के लिए F-परीक्षण, दोनों को करने की कोई आवश्यकता नहीं है।
- (e) $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + \varepsilon_i$ का OLS की सहायता से आकलन करने पर $\hat{Y}_i = \hat{\beta}_1 + \hat{\beta}_2 X_{2i} + \hat{\beta}_3 X_{3i}$ प्राप्त होता है। यहाँ X_2 व β_1 यादृच्छिक चर हैं तथा $\hat{\beta}_3$ अज्ञात है।
2. (a) For a given model, $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$, prove that if we omit X_3 (a relevant variable) then the OLS estimator of β_2 is not unbiased. What does the direction of the bias depend on ?

(b) Based on data collected on a particular Monday for 13 B.A. (H) Economics second year students we want to estimate the following population regression equation :

$$Y_i = \beta_1 + \beta_2 X_i + u_i$$

where :

Y_i : Travelling time (in hrs) for the i th student from her home to college.

X_i : Distance from home to college for i th student in km.

The sample gave the following values :

$$\sum X_i = 195, \sum Y_i = 26, \sum X_i^2 = 3050, \sum Y_i^2 = 53, \sum X_i Y_i = 400$$

Using the above data and assuming that all the CLRM assumptions are satisfied, establish a 95% confidence interval for the predicted mean travelling time when the distance between college and a student's house is 11 km. 5,10

(a) दिए गए मॉडल $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$ हेतु सिद्ध कीजिए कि यदि हम चर X_3 (एक प्रासंगिक चर) को छोड़ देते हैं तो β_2 का OLS आकलक अनभिन्नत नहीं होता। अभिन्नतता की दिशा किस पर निर्भर करती है ?

- (b) किसी सोमवार को B.A.(H) अर्थशास्त्र द्वितीय वर्ष की 13 छात्राओं से संग्रहित किए गए आँकड़ों के आधार पर हम निम्नलिखित समस्ति समाश्रयण समीकरण (Population regression equation) को आकर्तिक करना चाहते हैं :

$$Y_i = \beta_1 + \beta_2 X_i + u_i$$

जहाँ

Y_i : i वीं छात्रा के लिए उसके घर से कॉलेज की यात्रा में लगने वाला समय (घण्टों में)

X_i : i वीं छात्रा के लिए घर से कॉलेज तक की दूरी किमी में

इस प्रतिदर्श से निम्नलिखित मान प्राप्त हुए :

$$\Sigma X_i = 195, \Sigma Y_i = 26, \Sigma X_i^2 = 3050, \Sigma Y_i^2 = 53, \Sigma X_i Y_i = 400$$

यह मानते हुए कि CLRM की सभी मान्यताएँ सन्तुष्ट होती हैं, उपर्युक्त मानों की सहायता से यात्रा में लगने वाले समय पूर्वकथित माध्य हेतु 95% विश्वास्यता अन्तराल ज्ञात कीजिए यदि कॉलेज व एक छात्रा के घर के मध्य दूरी 11 किमी है।

3. (a) For the model $Y_i = \beta_1 + u_i$. Given that all the CLRM assumptions are satisfied, use OLS to find the estimator of β_1 . Show that this estimator can be decomposed into the true value plus a linear combination of the disturbance term in the sample. Also demonstrate that this estimator is an unbiased estimator of β_1 .

- (b) Based on data on GNP and money supply for the period 1965-2006 for India, the following regression results were obtained by regressing GNP (in billions of Rupees) on money supply (in billions of Rupees) for alternate models :

Model	Intercept	Slope	R²
	Coefficient ($\hat{\beta}_0$)	Coefficient ($\hat{\beta}_1$)	
Log-linear	0.8726 (11.40)	0.7839 (108.93)	0.927
Log-lin	6.2392 (75.85)	0.0002 (12.07)	0.852
Lin-log	14299 (14.45)	2383.4 (16.84)	0.879
Linear	603.28 (7.04)	0.3718 (55.58)	0.921

Where the figures in parentheses are *t*-ratios.

- (i) For each model, interpret the slope coefficient.
- (ii) For each model, estimate the elasticity of GNP with respect to money supply (sample means of the GNP and money supply are 5113.65 and 9347.53 respectively.)
- (iii) Are all R² values comparable ? If not, which ones are ?

- (a) मॉडल $Y_i = \beta_1 + u_i$ के लिए OLS की सहायता से β_1 का आकलक ज्ञात कीजिए। दर्शाइए कि इस आकलक को दो भागों में वियोजित किया जा सकता है, जहाँ एक भाग सही मान है तथा दूसरा भाग प्रतिदर्श में त्रुटि पद का रेखीय संयोजन (Linear Combination) है। यह भी दर्शाइए कि यह आकलक β_1 का एक अनभिन्नत (Unbiased) आकलक है।
- (b) 1965-2006 की अवधि के लिए भारत के लिए GNP व मुद्रा की आपूर्ति के आँकड़ों के आधार पर GNP (खरब रूपयों में) का मुद्रा की आपूर्ति (खरब रूपयों में) पर समाश्रयण करने पर निम्नलिखित समाश्रयण परिणाम प्राप्त हुए :

मॉडल	अन्तःखण्ड गुणांक ($\hat{\beta}_0$)	द्वाल गुणांक ($\hat{\beta}_1$)	R^2
Log-linear	0.8726 (11.40)	0.7839 (108.93)	0.927
Log-lin	6.2392 (75.85)	0.0002 (12.07)	0.852
Lin-log	14299. (14.45)	2383.4 (16.84)	0.879
Linear	603.28 (7.04)	0.3718 (55.58)	0.921

जहाँ कोष्ठकों में दी गई संख्याएँ t-मान हैं।

- (i) प्रत्येक मॉडल हेतु ढाल गुणांक की व्याख्या कीजिए।
- (ii) प्रत्येक मॉडल हेतु GNP की मुद्रा की आपूर्ति के सापेक्ष लोच आकलित कीजिए (GNP व मुद्रा की आपूर्ति के प्रतिदर्श माध्यों के मान क्रमशः 5113.65 तथा 9347.53 हैं।)
- (iii) क्या सारे R^2 मान तुलनीय हैं ? यदि नहीं, तो कौन-कौनसे तुलनीय हैं ?

4. (a) Elaborate how auxiliary/subsidiary regression can be used to detect the presence of multicollinearity. How is this method different from observing pairwise correlation coefficients ?

(b) To study the rate of growth of population of a country over the period 1970-1992, the following models were estimated :

$$\text{Model I : } \ln(\hat{\text{Pop}})_t = 4.73 + 0.024t$$

$$\text{se (0.5747) (.004)} \quad \text{RSS} = 100.515$$

$$\text{Model II : } \ln(\hat{\text{Pop}})_t = 4.77 + 0.015t - 0.075D_t + 0.011(D_t t)$$

$$\text{se (0.103) (0.0042) (0.018) (0.002)}$$

where

\ln : natural logarithm

Pop : population in millions

t : trend variable

$D_t = 1$ for observations 1978-1992

$= 0$ for observations 1970-1977

(i) In model I, what is the instantaneous rate of growth of the country's population over the sample period ?

(ii) What are the instantaneous rates of growth of population for the period 1970-1977 and for the period 1978-1992 ? Are these rates statistically different at 5% level of significance ?

(iii) The researcher also estimated separate regressions for the two time periods.

Time period : 1970-1977 : $RSS_A = 15.603$

Time period : 1978-1992 : $RSS_B = 52.752$

Apply the Chow test at 5% level of significance to determine if there is an evidence of a structural break in 1978.

5,1+5+4

P.T.O.

- (a) सहायक (Auxiliary/subsidiary) समाश्रयणों की सहायता से किस प्रकार बहुसरिखता का पता लगाया जा सकता है। विस्तार से विवेचन कीजिए। यह विधि युग्म-वारं (Pairwise) सहसम्बन्धों को प्रेक्षित करने से किस प्रकार भिन्न है ?
- (b) 1970-1992 के दौरान एक देश की जनसंख्या की वृद्धि दर का अध्ययन करने के लिए निम्नलिखित मॉडलों को आकलित किया गया :

$$\text{Model I : } \ln(\hat{\text{Pop}}_t) = 4.73 + 0.024t$$

$$\text{se (0.5747) (.004)} \quad \text{RSS} = 100.515$$

$$\text{Model II : } \ln(\hat{\text{Pop}}_t) = 4.77 + 0.015t - 0.075D_t + 0.011(D_t t)$$

$$\text{se (0.103) (0.0042) (0.018) (0.002)}$$

जहाँ

\ln : प्राकृतिक लघुगणक

Pop : जनसंख्या दस लाख में

t : प्रवृत्ति चर

$D_t = 1$, 1978-1992 के प्रेक्षणों हेतु

= 0, 1970-1977 के प्रेक्षणों हेतु

(i) मॉडल I में देश की जनसंख्या की प्रतिदर्शी की अवधि के दौरान तात्कालिक (Instantaneous)

वृद्धि दर क्या है ?

(ii) 1970-1977 व 1978-1992 की अवधियों के लिए जनसंख्या की तात्कालिक वृद्धि दरें

क्या-क्या हैं ? क्या ये दरें 5% सार्थकता स्तर पर सांख्यिकीय रूप से भिन्न हैं ?

(iii) शोधकर्ता ने दो अवधियों के लिए पृथक् समाश्रयण भी आकलित किए :

$$\text{कालावधि : } 1970-1977 : \quad RSS_A = 15.603$$

$$\text{कालावधि : } 1978-1992 : \quad RSS_B = 52.752$$

1978 में किसी संरचनात्मक परिवर्तन का प्रमाण है या नहीं, इस बात का निर्धारण चाऊ के परीक्षण 5% सार्थकता स्तर की सहायता से कीजिए।

5. (a) In the following linear model it was found that X_1 and X_2 are highly correlated.

$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + u_i$. Under which circumstances can this collinearity be ignored ?

(b) A researcher estimated the following regression :

$$\ln (\text{Salary})_i = 53.809 + .0438 \text{ Years}_i - 6.237 \text{ Years}_i^2 + e_i$$

$$t = (92.1) \quad (9.08) \quad (-5.19)$$

$$R^2 = 0.789 \quad n = 219$$

where

ln : natural log

Salary : Salary of an individual (Rs. '000s)

Years : Years of experience

When the White's General test for heteroscedasticity at 5% level of significance was conducted, the R^2 obtained from the regression of e_i^2 on a constant, Years, Years² and Years³ was 0.45. Is the researcher correct in concluding that Years and Years² are individually significant explanatory variables in the salary regression ? Why ? Why not ?

- (c) Explain with an example how you can deseasonalize a time series with the use of dummy variables. 5,5,5

- (a) निम्नलिखित रेखीय मॉडल में यह पाया गया कि X_1 व X_2 में काफी अधिक सहसम्बन्ध है।

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + u_i$$

किन परिस्थितियों में इस सरेखता की उपेक्षा की जा सकती है ?

- (b) एक शोधकर्ता ने निम्नलिखित समाश्रयण आकलित किया

$$\ln (\text{Salary})_i = 53.809 + .0438 \text{ Years}_i - 6.237 \text{ Years}_i^2 + e_i$$

$$t = (92.1) \quad (9.08) \quad (-5.19)$$

$$R^2 = 0.789 \quad = 219$$

जहाँ

In : प्राकृतिक लघुगणक

Salary : व्यक्ति का वेतन (हजारों रुपयों में)

Years : अनुभव, वर्षों में

जब प्रसरण-विषमता (Heteroscedasticity) हेतु व्हाइट का सामान्य परीक्षण किया गया तो स्थिरांक,

Years, Years² व Years³ पर e_i^2 के समाश्रयण में R² का मान 0.45 प्राप्त हुआ। क्या शोधकर्ता का यह निष्कर्ष सही है कि वेतन के समाश्रयण में Years व Years² व्यक्तिगत रूप से सांख्यिकीय रूप से सार्थक हैं ? क्यों या क्यों नहीं ?

(c) एक उदाहरण की सहायता से समझाइए कि आप डमी चरों की विधि की सहायता से एक काल-श्रेणी को विमौसमीकृत (Deseasonalize) किस प्रकार करेंगे ?

6. (a) Consider the following two variable population regression function :

$$Y_i = \beta_1 + \beta_2 X_{2i} + u_i$$

where $u_i \sim N(\text{mean} = 0, \text{variance} = \sigma_i^2)$ and σ_i^2 are known. Also u_i satisfied all other assumptions of CLRM. Now if you apply weighted least square then what will be the dependent and independent variables ? Will the sum of residuals be equal to zero in the transformed model ?

- (b) How do you test for normality of error terms in the population regression function using Jarque-Bera test.
- (c) Consider the following regression results :

$$\text{CHOL}_i = 7.23 + 1.39 \text{ DSed}_i + 2.1 \text{ Fat}_i + e_i$$

$$n = 35 \quad d = 1.42$$

where

CHOL_i : Level of cholesterol in blood (mg/ml)

$\text{DSed}_i = 1$ if sedentary lifestyle

= 0 otherwise

Fat_i : Intake of fats (gms/day)

Test if the model suffers from AR(1) autocorrelation at 5% level of significance.

- (d) For the model $\text{Y}_i = \beta_1 + \beta_2 \text{X}_{2i} + \beta_3 \text{Y}_{t-1} + u_i$, an auxiliary regression found :

$$\hat{u}_t = 2.3 + 1.539 \text{X}_{2t} + 1.32 \text{Y}_{t-1} + .892 \hat{u}_{t-1}$$

$$\text{se} = (0.99) \quad (.089) \quad (.051) \quad (.0058)$$

$$R^2 = 0.567 \quad n = 34$$

Use the Breusch-Godfrey test to check for the presence of AR(1) scheme of autocorrelation at 1% level of significance.

4,5,3,3

(a) निम्नलिखित द्वि-चर समस्ति समाश्रयण फलन पर विचार कीजिए :

$$Y_i = \beta_1 + \beta_2 X_{2i} + u_i$$

जहाँ $u_i \sim N(\text{माध्य} = 0, \text{प्रसरण} = \sigma^2)$ तथा σ^2 ज्ञात हैं। यह मानते हुए कि CLRM की अन्य सभी मान्यताएँ वैध हैं। अब यदि आप भारित न्यूनतम वर्ग विधि (Weighted least squares) विधि का उपयोग करें तो निर्भर व स्वतन्त्र चर क्या-क्या होंगे ? क्या भारित वर्ग विधि से प्राप्त अवशिष्टों का योगफल शून्य होगा ?

(b) आप जार्क-बीरा परीक्षण की सहायता से समस्ति समाश्रयण फलन में त्रुटि पदों की प्रसामान्यता हेतु परीक्षण किस प्रकार करेंगे ?

(c) निम्नलिखित समाश्रयण परिणामों पर विचार कीजिए :

$$\text{CHOL}_i = 7.23 + 1.39 \text{ DSed}_i + 2.1 \text{ Fat}_i + e_i$$

$$n = 35, \quad d = 1.42$$

जहाँ CHOL_i : रक्त में कॉलेस्टरॉल का स्तर (mg/ml)

DSed_i = डमी चर, = 1 यदि जीवनशैली गतिविहीन (Sedentary) है,

= 0 अन्यथा

Fat_i : वसा की खुराक (ग्राम प्रतिदिन)

क्या यह मॉडल AR(1) पद्धति द्वारा जनित स्वसहसम्बन्ध के लिए 5% सार्थकता स्तर से ग्रस्त है, परीक्षण कीजिए।

- (d) मॉडल $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 Y_{t-1} + u_i$ के लिए एक सहायक समाश्रयण से पता लगा कि

$$\hat{u}_t = 2.3 + 1.539X_{2t} + 1.32Y_{t-1} + .892\hat{u}_{t-1}$$

$se = (0.99) \quad (.089) \quad (.051) \quad (.0058)$

$R^2 = 0.567 \quad n = 34$

ब्रूश-गॉडफ्री परीक्षण की सहायता से AR(1) पद्धति द्वारा जनित स्वसहसम्बन्ध के लिए 1% सार्थकता स्तर पर परीक्षण कीजिए।

7. (a) Explain why it is impossible to fit a linear regression if there exist perfect linear relationship(s) between 2 or more explanatory variables. Give a technical/mathematical explanation.

Is the estimation still impossible if this linear relation is not perfect ? Why, why not ?

- (b) Let the population regression function be :

$$Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$$

How will you transform the model to obtain homoscedastic errors under each of the following cases, assuming other CLRM assumptions for u_i hold :

$$(i) \quad u_i = \varepsilon_i (X_{2i})^{1/2}$$

$$(ii) \quad u_i = \varepsilon_i Z_i \text{ (where } Z_i \text{ is a non-stochastic variable which does not belong to this model)}$$

$$(iii) \quad E(u_i^2) = \sigma^2 / X_{3i}$$

It is given that $\varepsilon_i \sim N$ (mean = 0, variance = σ^2)

- (c) For the following estimated model can we test for AR(1) scheme of autocorrelation using Durbin-Watson d -test ? Why or why not ? Use the relevant test at 5% level of significance to check for autocorrelation :

$$Y_t = 4.291 + 1.24X_{1t} - 3.546X_{2t} + 0.0273Y_{t-1} + e_t$$

$$Se = (1.24) \quad (0.36) \quad (0.34) \quad (.0981)$$

$$R^2 = 0.92 \quad d = 1.32 \quad n = 40.$$

5,2+2+2,4

P.T.O.

- (a) यदि दो या अधिक व्याख्याकारी चरों के मध्य पूर्ण रेखीय सम्बन्धों का अस्तित्व है, तो एक रेखीय समाश्रयण फिट करना सम्भव क्यों नहीं है, इस हेतु तकनीकी/गणितीय स्पष्टीकरण दीजिए। यदि रेखीय सम्बन्ध पूर्ण नहीं हो तो भी क्या आकलन असम्भव है ? क्यों या क्यों नहीं ?
- (b) मान लीजिए कि समष्टि समाश्रयण फलन निम्न प्रकार है :

$$Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$$

निम्नलिखित स्थितियों में प्रसरणसम (Homoscedastic) त्रुटियाँ प्राप्त करने हेतु मॉडल को किस प्रकार रूपान्तरित करेंगे, यह मानते हुए कि CLRM की अन्य सभी मान्यताएँ वैध हैं :

$$(i) \quad u_i = \varepsilon_i (X_{2i})^{1/2}$$

$$(ii) \quad u_i = \varepsilon_i Z_i \quad (\text{जहाँ } Z_i \text{ एक अयादृच्छिक (non-random) चर है जो कि इस मॉडल में नहीं है})$$

$$(iii) \quad E(u_i^2) = \sigma^2 / X_{3i}$$

यह दिया हुआ है कि $\varepsilon_i \sim N(\text{माध्य} = 0, \text{प्रसरण} = \sigma^2)$

(c) निम्नलिखित आकलित मॉडल में AR(1) पद्धति के स्वसहसम्बन्ध की उपस्थिति के लिए क्या डर्बिन-वॉट्सन के d -परीक्षण की सहायता से परीक्षण किया जा सकता है ? क्यों या क्यों नहीं ? 5% सार्थकता स्तर पर स्वसहसम्बन्ध की उपस्थिति के लिए उचित परीक्षण कीजिए।

$$Y_t = 4.291 + 1.24X_{1t} - 3.546X_{2t} + 0.0273Y_{t-1} + e_t$$

$$Se = (1.24) \quad (0.36) \quad (0.34) \quad (.0981)$$

$$R^2 = 0.92 \quad d = 1.32 \quad n = 40.$$

Note: This table gives the area in the right-hand tail of the distribution (i.e., $Z \geq 0$). But since the normal distribution is symmetrical about $Z = 0$, the area in the left-hand tail is the same as the area in the corresponding right-hand tail. For example, $\Pr(-1.96 \leq Z \leq 0) = 0.4750$. Therefore, $\Pr(-1.96 \leq Z \leq 1.96) = 2(0.4750) = 0.95$.

TABLE I PERCENTAGE POINTS OF THE t DISTRIBUTION**Example**

$$\Pr(t > 2.086) = 0.025$$

$$\Pr(t > 1.725) = 0.05 \quad \text{for } df = 20$$

$$\Pr(|t| > 1.725) = 0.10$$

EXAMPLE
If $n = 40$ and $k' = 4$, $d_L = 1.285$ and $d_U = 1.721$. If a computed d value is less than 1.285, there is evidence of positive first-order serial correlation; if it is greater than

1.721, there is no evidence of positive first-order serial correlation; but if d lies between the lower and the upper limit, there is inconclusive evidence regarding the presence or absence of positive first-order serial correlation.

Source: This table is an extension of the original Durbin-Watson table and is reproduced from N. E. Savin and K. J. White, "The Durbin-Watson Test for Serial Correlation with Extreme Small Samples or Many Regressors," *Econometrica*, vol. 45, November 1977, pp. 1989-96 and as corrected by R. W. Farebrother, *Econometrica*, vol. 48, September 1980, p. 1554. Reprinted by permission of the Econometric Society.

Note: n = number of observations, k' = number of explanatory variables excluding the constant term.
